### LOW IMPACT DEVELOPMENT COUPLED WITH FLOOD MITIGATION

# CDM Smith

Richard Wagner, P.E., D.WRE

Seth Nehrke, P.E., D.WRE

2013 Jacksonville Environmental Symposium

## Examples of Low Impact Development (LID) Considerations in Jacksonville

- Master Stormwater Management Plan (MSMP) 1992
  - Floodplain and floodway protection
  - Volume-time detention
  - Stormwater project components
- City of Jacksonville LID Manual
- Wurn and Fletcher Morgan Parks study
- Valens Drive study

City of Jacksonville Preliminary LID Manual Focuses on Right-of-Way LID Applications

- Conveyance and landscape swales
- Bioretention
- Pervious pavement

#### **Benefits of LID Practices**

- Water quality
  - Pollutant loads are reduced in proportion to runoff volume reduction
  - Reduced size requirement for ponds with LID in tributary area
  - Improved water quality and lower temperature discharges
- Water quantity
  - Increased groundwater infiltration, recharge, and baseflow
  - May result in reduced pipe sizes and storage volume requirement for pond with LID in tributary area
  - Reduced discharge volumes
  - Reductions in potable water supply use by landscape irrigation

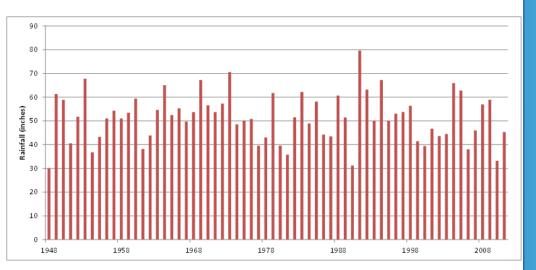

## **Evaluation of Runoff Control Practices**

- Goal: reasonable water budget and seasonal water table representation
- Long-term H&H and water quality simulations using SWMM5
  - Pre-development (runoff, groundwater) for undeveloped (pervious) land
  - Post-development: impervious land (e.g., roadway, parking lot) routed to LID feature
  - Determine average annual % runoff capture

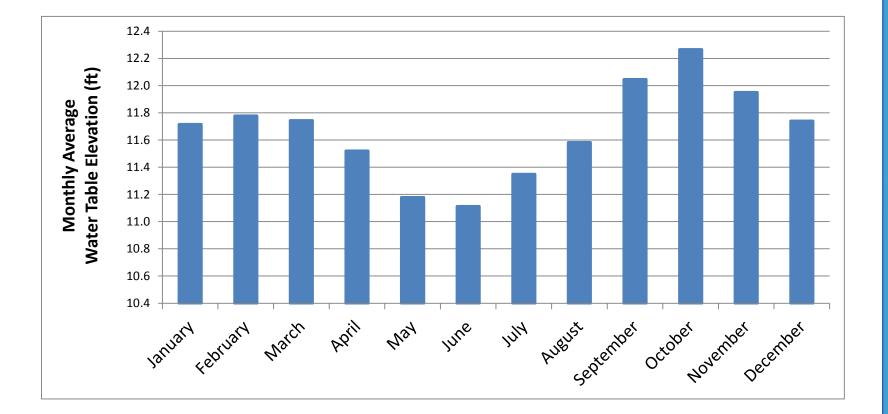

#### SWMM5 – Undeveloped Area

- Long-term simulations using SWMM5
  - Surface runoff
     hydrologic parameters
     based on
     MSMP modeling
  - Added groundwater parameter values for calculation of baseflow
  - Target: Rainfall
     converted to roughly
     30% streamflow, 70% ET

#### SWMM5 – Undeveloped Area: Simulated Seasonal Water Table

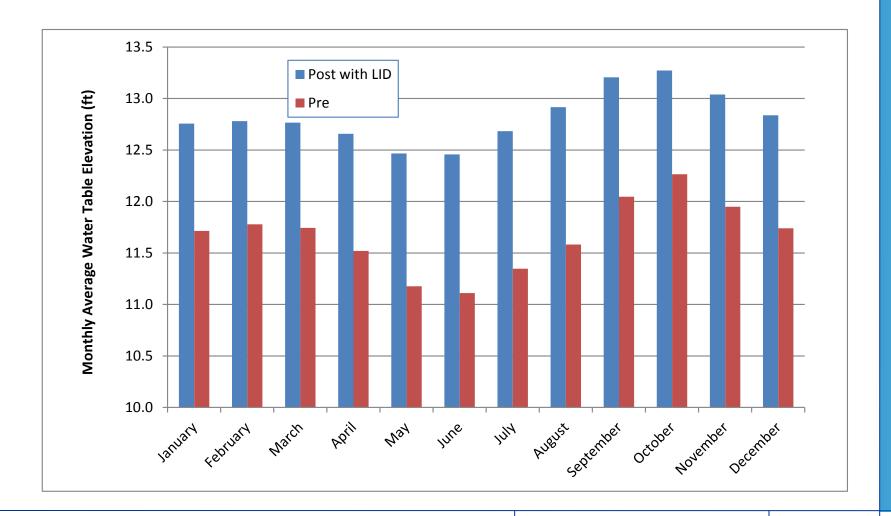

#### SWMM5 – Developed Area

- Long-term simulation with impervious area runoff routed to LID feature
  - Various ratios of impervious tributary area to LID surface area
  - Typical design characteristics for LID feature (e.g., bioretention ponding depth and planting media depth)
- Goal: determine runoff capture efficiency based on LID storage/treatment volume

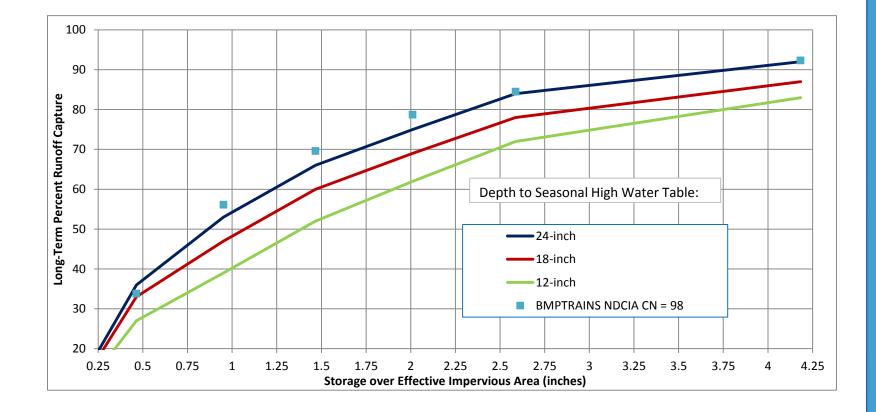

#### SWMM5 – Model Shows Higher Local Water Table After Development with LID

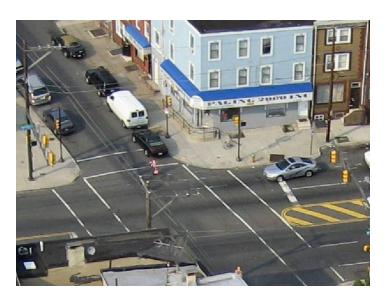

# Results Based on Storage Volume and Depth to Seasonal High Water Table

#### **Other Potential LID Practices**

- Reduced roadway widths
- Filter strips
- Curb extensions
- Landscaping planter boxes

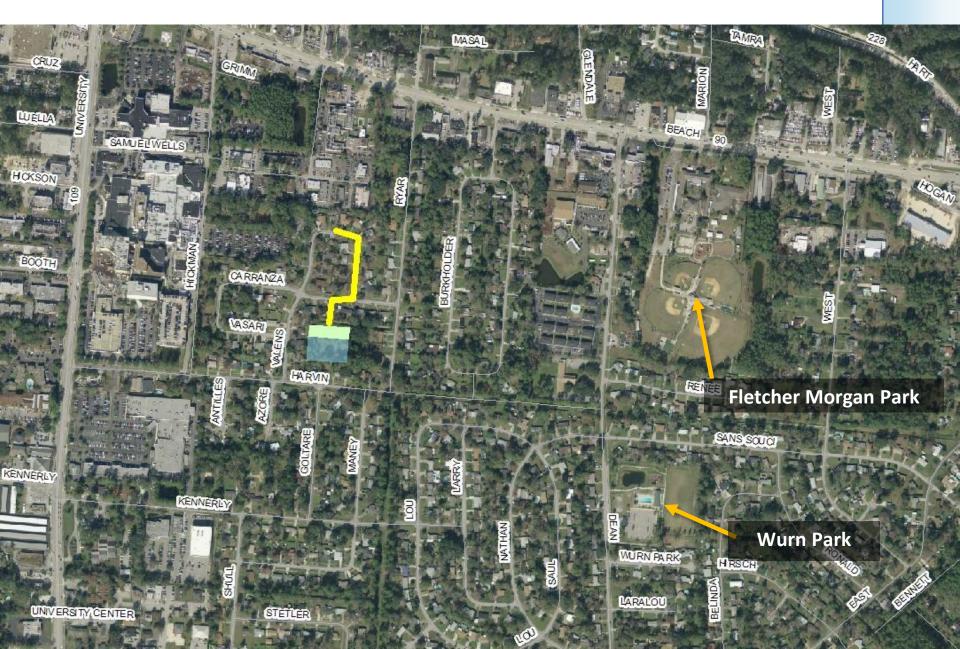

#### **Example Studies in Jacksonville**

- Wurn and Fletcher Morgan Parks
  - Opportunity for stormwater irrigation from existing ponds
  - In tributary area to impaired waters (Pottsburg Creek, Lower St. Johns River)
- Valens Drive
  - Known area of nuisance flooding
  - In tributary area to impaired waters (Pottsburg Creek, Lower St. Johns River)
- Evaluation Aspects
  - Benefits (e.g., increased infiltration and recharge, volume and load reduction, peak stages reduced, potable water use reduction)
  - Costs

#### **Recreational LID Demonstration Projects**

#### LID Retrofit Opportunities: Public Facilities

Smith

#### Fletcher Morgan Recreational LID

#### LID Retrofit Opportunities: Public Facilities

CD

Smith

#### Stormwater Irrigation Evaluation

- Define irrigation and tributary areas
- Determine irrigation demand
- Quantify savings

#### **Stormwater Irrigation Evaluation**

#### **Define Irrigation & Tributary Areas**

#### Irrigation Areas Tributary Area for Harvesting Piped Conveyance End Walls

0

Figure 1-1 City of Jacksonville Wurn and Fletcher Morgan Park Stormwater Harvesting Pilot Study Location Map

#### Analyze Supply and Demand
